Basic concepts of Quadratic Functions

Vaibhav Ranshoor [171080067]

VJTI

Objectives

Objectives for today:

- Introducing specific vocabulary.
- Quick revision of quadratic function.
- Factorising Quadratics.
- Proving Vieta's formulas.
- Carrying out gained knowledge by working out some word problems.

Quick Revision

Forms of Quadratic Function

- $f(x) = ax^2 + bx + c$ is called the **standard** form.
- $f(x) = a(x x_1)(x x_2)$ is called the **factored** form, where x_1 and x_2 are the roots of the quadratic function.
- $f(x) = a(x h)^2 + k$ is called the **vertex form**.

Delta Δ

 Δ determines tells us how many solutions quadratic equation have:

number of solutions =
$$\begin{vmatrix} 2 & \text{when } \Delta > 0 \\ 1 & \text{when } \Delta = 0 \\ 0 & \text{when } \Delta < 0 \end{vmatrix}$$

The Quadratic Formula

$$x = \frac{-b \pm \sqrt{\Delta}}{2a}$$

Graph of Quadratic Function

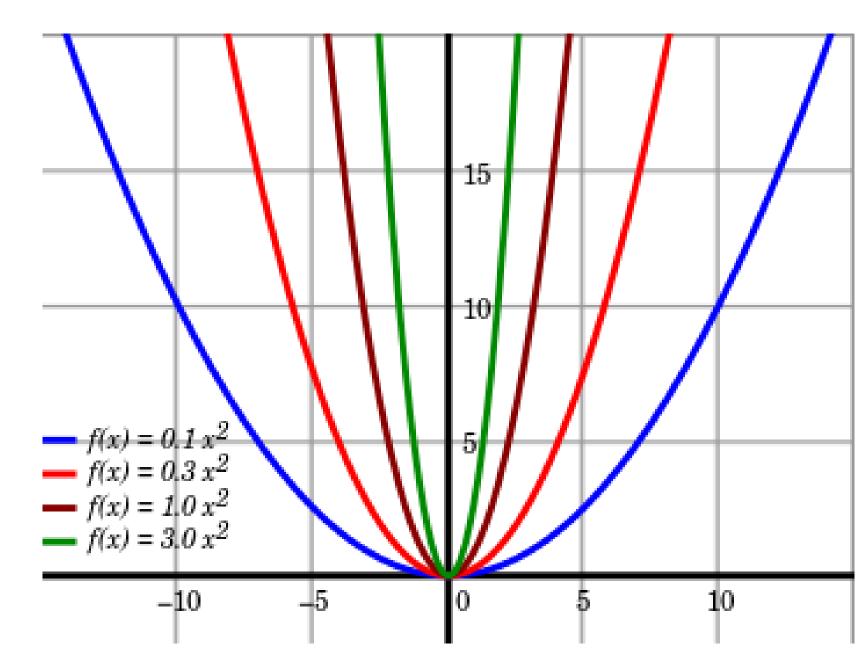

Figure 1: Graph of $f(x) = ax^2|_{\{0.1,0.3,1.0,3.0\}}$

Factorising a Quadratic

Factorising a quadratic means putting it into two brackets, and is useful if you're trying to draw a graph of a quadratic solve a quadratic equation. It's pretty easy if a = 1 (in $ax^2 + bx + c$ form), but can be a real pain otherwise.

In order to factorise a quadratic you should follow steps outlined below:

- Rearrange the equation into the standard $ax^2 + bx + c$ form.
- 2 Write down two brackets: (x)(x)
- 3 Find two numbers that multiply to give 'c' and add or subtract to give 'b' (ignoring signs).
- 4 Put the numbers in brackets and choose their signs.

Factorising- Tasks

1. Factorise $x^2 - x - 12$. = $x^2 - 4x + 3x - 12$ = [x - 4][x + 3]Factors are x = 4 and x = 3

2. Solve $x^2 - 8 = 2x$ by factorising. $= x^2 - 4x + 2x - 8 = [x - 4][x - 2]$ factors are x = 4 and x = 2

Vieta's Formulas- Task

1. Prove that

$$x_1 x_2 = \frac{c}{a}$$

The roots of the quadratic equation are given by $x=[-b\pm\sqrt{(b^2-4ac)}]/2a$

so one root is $x=[-b+\sqrt{(b^2-4ac)}]/2a//andthese condroot is <math>x=[-b-\sqrt{(b^2-4ac)}]/2a$

The numerator is the difference of two squares in reverse ... $(a+b)(a-b)=a^2-b^2...so$:

$$x_1 x_2 = c/a$$

Glossary

| verb | noun | meaning |
|------------|----------------|----------------|
| add | addition | + |
| subtract | subtraction | |
| multiply | multiplication | • |
| divide | division | • |
| solve | solution | getting answer |
| substitute | substitution | $t = x^2$ |

Table 1: Word Formation

Myth of Delta Δ

It's commonly believed that in order to work out roots of a quadratic function you must count Δ and use other previously established formulas. However this is untrue since factorising in many cases is as good or even better than simply counting Δ .

Example of Factorisation

Solve $x^2 + 4x - 21 = 0$ by factorising.

$$x^2 + 4x - 21 = (x)(x)$$

1 and 21 multiply to give 21 - and add or subtract to give 22 and 20.

3 and 7 multiply to give 21 - and add or subtract to give 10 and 4.

$$x^2 + 4x + 21 = (x+7)(x-3)$$

And solving the equation:

$$(x+7)(x-3) = 0$$

we get

$$x = -7, \quad x = 3$$

Proof of Vieta's Formulas

Let's prove that:

$$x_1 + x_2 = \frac{-b}{a}$$

When Δ is positive we have two roots:

$$x_1 = \frac{-b - \sqrt{\Delta}}{2a}, \quad x_2 = \frac{-b + \sqrt{\Delta}}{2a}$$

Substituting for x_1 and x_2 respectively, we receive:

$$x_1 + x_2 = \frac{-b - \sqrt{\Delta}}{2a} + \frac{-b + \sqrt{\Delta}}{2a} = \frac{-b - \sqrt{\Delta}}{2a} =$$

$$= \frac{(-b - \sqrt{\Delta}) + (-b + \sqrt{\Delta})}{2a} = \frac{-2b}{2a} = \frac{-b}{a}$$

The same we could do with another pattern, which state that $x_1x_2 = \frac{c}{a}$, but proving this is going to be your task in next section.

Some Necessary and Useful Vocabulary

 \bullet (n.) sign \rightarrow + or -

• (n.) equation $\rightarrow something = 0$

• (n.) factor \rightarrow two multiplied factors give result

• (v.) factorise \rightarrow putting into brackets

• (n.) coefficient \rightarrow a constant number i.e. a, b, c in a pattern $ax^2 + bx + c$

• (n.) quadratic function $\rightarrow f(x) = ax^2 + bx + c$

• (n.) root $\rightarrow \sqrt{sth}$ or solution of quadratic equation

• (n.) formula = pattern
